WGen 7500DF
Dual Fuel Portable Generator
GASOLINE: 7500 Running Watts | 9500 Peak Watts
PROPANE: 6750 Running Watts | 8550 Peak Watts
SAVE THESE INSTRUCTIONS
Important safety instructions are included in this manual.

California Proposition 65 Warning
The engine exhaust from this product contains chemicals known to the state of California to cause cancer, birth defects or other reproductive harm.

California Proposition 65 Warning
Certain components in this product and its related accessories contain chemicals known to the state of California to cause cancer, birth defects or other reproductive harm. Wash hands after handling.

DISCLAIMERS:
All information, illustrations and specifications in this manual are based on the latest information available at the time of publishing. The illustrations used in this manual are intended as representative reference views only. Moreover, because of our continuous product improvement policy, we may modify information, illustrations and/or specifications to explain and/or exemplify a product, service or maintenance improvement. We reserve the right to make any change at any time without notice. Some images may vary depending upon which model is shown.

ALL RIGHTS RESERVED:
No part of this publication may be reproduced or used in any form by any means – graphic, electronic or mechanical, including photocopying, recording, taping or information storage and retrieval systems – without the written permission of MWE Investments LLC.

DANGER
This manual contains important instructions for operating this generator. For your safety and the safety of others, be sure to read this manual thoroughly before operating the generator. Failure to properly follow all instructions and precautions can cause you and others to be seriously hurt or killed.

IMPORTANT: KEEP YOUR PURCHASE RECEIPT TO ENSURE TROUBLE-FREE WARRANTY COVERAGE.

PRODUCT REGISTRATION
To ensure trouble-free warranty coverage, it is important you register your Westinghouse generator.
You can register your generator by either:
1. Filling in the product registration form below and mailing to:
   **Product Registration**
   MWE Investments LLC
   777 Manor Park Drive
   Columbus, Ohio 43228

2. Registering your product Online at www.westinghouseportablepower.com/register-your-product/
   To register your generator you will need to locate the following information:

SAFETY DEFINITIONS
The words DANGER, WARNING, CAUTION and NOTICE are used throughout this manual to highlight important information. Be certain that the meanings of these alerts are known to all who work on or near the equipment.

This safety alert symbol appears with most safety statements. It means attention, become alert, your safety is involved! Please read and abide by the message that follows the safety alerts symbol.

DANGER
Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING
Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION
Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE
Indicates a situation which can cause damage to the generator, personal property and/or the environment, or cause the equipment to operate improperly.

NOTE: Indicates a procedure, practice or condition that should be followed in order for the generator to function in the manner intended.

## GENERAL SAFETY RULES

### DANGER

Never use the generator in a location that is wet or damp. Never expose the generator to rain, snow, water spray or standing water while in use. Protect the generator from all hazardous weather conditions. Moisture or ice can cause a short circuit or other malfunction in the electrical circuit.

Never operate the generator in an enclosed area. Engine exhaust contains carbon monoxide. Only operate the generator outside and away from windows, doors and vents.

### WARNING

Voltage produced by the generator could result in death or serious injury.
- Never operate the generator in rain or a flood plain unless proper precautions are taken to avoid being subject to rain or a flood.
- Never use worn or damaged extension cords.
- Always have a licensed electrician connect the generator to the utility circuit.
- Never touch an operating generator if the generator is wet or if you have wet hands.
- Never operate the generator in highly conductive areas such as around metal decking or steel works.
- Always use grounded extension cords. Always use three-wire or double-insulated power tools.
- Never touch live terminals or bare wires while the generator is operating.
- Be sure the generator is properly grounded before operating.

Gasoline, gasoline vapors & liquid petroleum gas (LPG) are extremely flammable and explosive under certain conditions.
- Always refuel the generator outdoors, in a well-ventilated area.
- Never remove the fuel cap with the engine running.
- Never refuel the generator while the engine is running. Always turn engine off and allow the generator to cool before refueling.
- Only fill fuel tank with gasoline.
- Keep sparks, open flames or other form of ignition (such as matches, cigarettes, static electric sources) away when refueling.
- Never overfill the fuel tank. Leave room for fuel to expand. Overfilling the fuel tank can result in a sudden overflow of gasoline and result in spilled gasoline coming in contact with HOT surfaces. Spilled fuel can ignite. If fuel is spilled on the generator, wipe up any spills immediately. Dispose of rag properly. Allow area of spilled fuel to dry before operating the generator.
- Wear eye protection while refueling.
- Never use gasoline as a cleaning agent.
- Store any containers containing gasoline or propane in a well-ventilated area, away from any combustibles or source of ignition.
- Check for fuel leaks after refueling. Never operate the engine if a fuel leak is discovered.

### WARNING

Never use the generator if powered items overheat, electrical output drops, there is sparking, flames or smoke coming from the generator, or if the receptacles are damaged.

Never use the generator to power medical support equipment.

Always remove any tools or other service equipment used during maintenance from the generator before operating.

### NOTICE

Never modify the generator.

Never operate the generator if it vibrates at high levels, if engine speed changes greatly or if the engine misfires often.

Always disconnect tools or appliances from the generator before starting.
SAFETY

SAFETY LABELS AND DECALS

1. MAINTAIN AIR CLEANER
   - Moscow with cleaning solvent and dry cloth every 25 hours (every 100 hours if operating in dusty conditions). Then remove any cake engine oil with suction. Squeeze out excessive oil.

2. FUEL
   - For technical assistance or service call toll free 1-855-944-3571

3. PART NO.
   - Designed in Columbus, Ohio USA

4. DANGER
   - Read owner’s manual before operating generator on LPG/propane or LPG. Propane is highly flammable. Leaking LPG can cause a fire or explosion! Fight fire with water or powder type extinguishers. If you smell LPG while you are operating unit, immediately shut off propane valve. Keep propane tank away from motor.

5. WARNING
   - Hot surfaces
   - Advertencia
   - Superficies calientes

6. 1-855-944-3571

Westinghouse Portable Power | 7
SAFETY

SAFETY LABELS AND DECALS

**DANGER**

Read the owner’s manual and follow all safety procedures prior to operating the generator. Failure to follow these instructions may lead to serious injury, property damage or death. Never add fuel to generator when the engine is hot or running. Never allow fuel to come in contact with burning engine or hot generator parts. Always allow engine to cool down before adding fuel. Never touch hot surfaces. Generators produce lot of shock especially if operated by damp or wet conditions. Keep generator and stored fuel away from sparks and cigarettes. Never connect to a highly resistive system unless a transfer switch has been provided by a certified electrician.

**PELIGRO**

Lea el manual del propietario y siga todas las procedimientos de seguridad antes de hacer funcionar el generador. No seguir estos instrucciones puede causar lesiones graves, daños a la propiedad o la muerte. Nunca agregue combustible al generador cuando el motor está caliente o en marcha. Nunca permita que el combustible entre en contacto con el motor en marcha o partes calientes del generador. Siempre permita que el motor se enfríe antes de agregar combustible. Nunca toque las superficies calientes. Los generadores producen una carga muy alta especialmente si se opera en condiciones húmedas o mojadas. Mantenga el generador y el combustible alejado de chispas o cigarrillos. Nunca conecte a un sistema de alta resistencia a menos que un interruptor de transferencia haya sido instalado por un electricista certificado.

**WARNING**

Necesite un sistema de transferencia. 
Antes de hacer funcionar el generador, asegúrese de que el sistema eléctrico esté en buen estado de funcionamiento.

**AVERTISSEMENT**

Il est nécessaire de disposer d’un système de transfert. 
Avant d’opérer le générateur, assurez-vous que le système électrique est en bon état de fonctionnement.

**DANGER**

Using a generator inside can kill you in minutes! Generator exhaust contains carbon monoxide. This is a poison you cannot see or smell.

**PELIGRO**

Usar el generador en interiores puede matarlo en minutos. El escape del generador contiene monóxido de carbono. Este gas es venenoso y no puede verse ni oler.

**WARNING/AVERTISSEMENT**

Toxic fumes hazard. Running engines gives off carbon monoxide, an odorless poisonous gas that can cause nausea, fainting, or death. Do not start engine indoors or in an enclosed area, even if the windows and doors are open.

**DANGER TOXIQUE.** 
Faire fonctionner un moteur dégagé de l’oxyde de carbone, un gaz inodore toxique qui peut provoquer la nausée, l’évanouissement ou la mort. Ne démarrez pas le moteur à l’intérieur ou dans une espace clos, même si les fenêtres et les portes sont ouvertes.

**WARNING/AVERTISSEMENT**

TOXIC FUMES HAZARD. Running engines gives off carbon monoxide, an odorless poisonous gas that can cause nausea, fainting, or death. Do not start engine indoors or in an enclosed area, even if the windows and doors are open.

**DANGER TOXIQUE.**

**SAFETY**

**FUEL SAFETY**

**DANGER**
Gasoline and liquid petroleum gas (LPG) are highly explosive and flammable. Explosions and fire can cause severe burns or death.

**Gasoline and gasoline vapor (Gas)**
- Gasoline is highly flammable and explosive.
- Gas expands and contracts with different temperatures.
- In case of a gas fire, do not attempt to extinguish the flame if the fuel shutoff valve is in the on position. Introducing an extinguisher to a generator with an open fuel valve could create an explosion hazard.
- Gas has a distinctive odor, this will help detect potential leaks quickly.
- Gas vapors can cause a fire if ignited.
- Gasoline is a skin irritant and needs to be cleaned up immediately if it comes in contact with the skin.

**Liquid Petroleum Gas (Propane/LPG)**
- LPG/Propane is highly flammable and explosive.
- Flammable gas under pressure can cause a fire or explosion if ignited.
- LPG/Propane can settle in low places because it is heavier than air.
- LPG/Propane has a distinctive odor added to help detect potential leaks.
- Always keep LPG/Propane tank in an upright position.
- When exchanging LPG/Propane tanks, be sure the tank value is the same type.
- In case of a LPG/Propane fire, do not attempt to extinguish unless the fuel supply can be shut off.
- LPG/Propane will burn the skin. Prevent skin contact at all times.

**WARNING**
- Never use a gas container, LPG connector hose, LPG tank or any other fuel item that appears to be damaged.

**When transporting or servicing the generator:**
- Make certain the fuel shutoff valve is off and the fuel tank is empty.
- Make sure the LPG tank and LPG hose is not attached to the generator.
- Disconnect the spark plug wire.

**When storing the generator:**
- Store away from sparks, open flames, pilot lights, heat and other sources of ignition.
- Do not store gas or LPG tank near furnaces, water heaters or any other appliances that produce heat or have automatic ignitions.

**CAUTION**
- Only use approved LPG tanks with OPD (overfilling prevention device) valve. Always keep the tank in a vertical position with the valve on top and installed at ground level on a flat surface. Do not allow tanks to be exposed to the sun, rain and dust. When transporting and storing, turn off the tank valve and fuel valve, and disconnect the tank. Make sure to always cover the generator and tank outlet with protective plastic caps.

**WARNING**
- If there is a strong smell of propane while operating the generator close the valve on the propane tank immediately. Once the propane is off, use soapy water to check for leaks on the hose and connections on the tank valve and the generator. Do not smoke or light a cigarette or check for leaks using any open flame source such as a match or lighter. If a leak is found contact a qualified technician to inspect and repair the LPG system before using the generator.

**WARNING**
- Never place propane tank near engine exhaust.
Tools required – box cutter or similar device.
1. Carefully cut the packing tape on top of the carton.
2. Fold back top flaps to reveal the manual.
3. Remove the Wheel Kit Accessories cardboard box.
4. Carefully cut two sides of the carton to remove the generator.

WHAT COMES IN THE BOX
Manual
Quick Start Guide/Maintenance Schedule
LPG Hose (1)
Wireless Remote Starter (1)
1.1 Liter Bottle of SAE 10W30 Oil (1)
Spark Plug Socket Wrench (1)
Wheel Kit Accessories Box
Battery Charger (1)
Funnel (1)

WHEEL KIT ACCESSORIES BOX
Open the Wheel Kit Accessories box and verify the contents against the list right. If any parts are missing, contact our service team at service@wpowereq.com or call 1-855-944-3571.
INSTALLING WHEELS AND FEET

BEFORE ASSEMBLING THE GENERATOR, REVIEW THE SAFETY SECTION STARTING ON PAGE 5.

⚠️ CAUTION

Never lift the generator without assistance. The generator is heavy and lifting without assistance could result in personal injury.

Never use the handles as a lifting point to support the entire weight of the generator. Only use the handles to move the generator by lifting the handles and using the wheels to move the generator.

Use caution when collapsing the handles. Hands and fingers could get caught and pinched.

NOTICE

Assembling the generator will require lifting the unit on one side. Make sure all engine oil and fuel are drained from the unit prior to assembling. Once assembled, the wheel kit is not intended for on-road use. The wheel kit is designed for use on this generator only.

INSTALLING FEET TO FRAME

1. Place generator on a flat surface.

2. Place a piece of cardboard or other soft material to tip the generator onto, to protect the frame paint and prevent the generator from sliding. Tip the generator onto the side.

3. Install the mounting foot to the frame using M8 flange bolts.

   1 - Mounting Feet
   2 - Flange Bolts M8

INSTALLING WHEELS TO FRAME

1. Insert axle pin through washer and wheel.

   Figure 2 - Wheel Assembly

2. Install the wheel with axle pin through the axle bracket on the frame. The eye of the bolt should be facing toward the inside of the generator.

   Figure 3 - Assemble Wheel to Frame

3. Install the hairpin cotter through the axle pin to lock it in place.

   1 - Axle Bracket
   2 - Hairpin Clip
   3 - Axle Pin

4. Repeat previous steps on other wheel.
INSTALLING THE BATTERY

**WARNING**
To avoid electric shock:
- ALWAYS connect the positive (+) battery cable (red boot) first when connecting battery cables.
- ALWAYS disconnect the negative (-) battery cable (black boot) first when disconnecting battery cables.
- NEVER connect the negative (-) battery cable (black boot) to the positive (+) post on the battery.
- NEVER connect the positive (+) battery cable (red boot) to the negative (-) post on the battery.
- NEVER touch both battery posts simultaneously.
- NEVER place a metal tool across both battery posts.
- ALWAYS use insulated or nonconductive tools when installing the battery.

1. Secure the positive (+) battery cable (red boot) tightly to the positive (+) battery post. Make sure boot is over battery post.

2. Carefully remove the protective wrapping around the lug of the negative (-) battery cable (black boot).

3. Locate negative (-) cable attached to alternator cable, remove tie and route to the negative (-) battery post. See figure 4 below for location of negative (-) cable.

4. Pull back the black boot and securely attach the negative (-) battery cable (black boot) to the negative (-) battery post as shown in Figure 5. Replace the black boot so it protects the cable lug and battery post.

**NOTICE**
The electric start generator is equipped with a battery charging feature. Once the engine is running, a small charge is supplied to the battery via the battery cables and will slowly recharge the battery.

**NOTICE**
Even if you do not plan on using the electric start feature you will still need to install the battery (even if it is dead) to complete the circuit in order for the automatic choke mechanism to work properly. Pull cord starting will not work without the battery being installed.

---

Figure 4 - (1) Negative Cable

Figure 5 - Attaching the Negative (-) Battery Wire (black)

1 - Positive (+) Battery Cable (Red)
2 - Negative (-) Battery Cable (Black)
**FEATURES**

1. **Fuel Selector Switch**: Used to select and turn on gasoline or propane fuel source.

2. **Push Button Electric Start**: Starts and stops the engine.

3. **Engine Control Switch/Battery Disconnect**: Allows fuel to flow to engine and energizes the ignition system. Also, disconnects battery power when in STOP position.

4. **Fuel Cap**: Close until clicking sound is heard.

5. **Control Panel**: Contains the circuit breakers and outlets.

6. **Battery**: Included for electric start models.

7. **Oil Fill Plug/Dipstick**: Must be removed to add and check oil.

8. **Oil Drain Plug**: Must be removed to drain engine oil.

9. **Propane Hook Up**: Hook up your propane tank with the LPG hose provided to this inlet.

10. **Never Flat Wheels**: For easy portability

11. **Auto Choke**: Battery must be hooked up for auto choke to work properly.

12. **Gas Fuel Shut Off Valve**: Controls the flow of gas to the engine.

13. **Single Piece Handle**: Includes rubber grip. Allows you to easily push or pull unit with one hand.
FEATURES

1 Fuel Gauge: Indicates gas level.

2 Spark Plug Boot (Wire): Must be removed when servicing the engine or the spark plug.

3 CARB Canister: Required for models sold into and used in California.

4 Muffler and Spark Arrester: Avoid contact until engine is cooled down. Spark arrester prevents sparks from exiting the muffler. It must be removed for servicing.
1. **Fuel Selector Switch**: Select and turn on gas or propane.

2. **Push Start Button**:
   - Push for 1 second to automatically start the engine. Green light shows when unit is on.
   - Push again to stop the engine.

3. **Engine Control Switch/Battery Disconnect**: Switch to **STOP** to stop the engine. When in **STOP** position it prevents the unit from drawing power from the battery. Switch to **RUN** before starting engine.

4. **5V USB Ports**: 5V DC that come in 1 amp and 2.1 amps.

5. **Main Circuit Breaker**: The main circuit breaker controls total output of all outlets to protect the generator.

6. **120-Volt, 20-Amp Duplex GFCI Outlets (NEMA 5-20R)**: Each outlet is capable of carrying a maximum of 20 amps on a single receptacle or a combination of both receptacles.

7. **120/240-Volt, 30-Amp Twist Lock Outlet (NEMA L14-30R)**: Outlet can supply either 120V or 240V output.

8. **Battery Indicator Light**: When light is illuminated, the battery is connected.

9. **Smart Switch Outlet**: Connects the Westinghouse ST Switch (sold separately) to the control panel.

10. **Battery Charge Port**: Used to charge the battery when the unit is off (battery charger included).

11. **Data Center**: Displays how many hours the generator has been run when under load.

12. **Ground Terminal**: The ground terminal is used to ground the generator.

13. **20-Amp Circuit Breakers**: Each circuit breaker limits the current that can be delivered through the 120-volt duplex outlets to 20amps.
BEFORE STARTING THE GENERATOR

Location Selection – Before starting the generator, avoid exhaust and location hazards by verifying:

- You have selected a location to operate the generator that is outdoors and well ventilated.
- You have selected a location with a level and solid surface on which to place the generator.
- You have selected a location that is at least 6 feet (1.8 m) away from any building, other equipment or combustible material.
- If the generator is located close to a building, make sure it is not located near any windows, doors and/or vents.

**DANGER**

Using a generator indoors **CAN KILL YOU IN MINUTES.**
Generator exhaust contains carbon monoxide. This is a poison you cannot see or smell.

Never use inside a home or garage, EVEN IF doors and windows are open. Only use OUTSIDE and far away from windows, doors, and vents.

Avoid other generator hazards. READ MANUAL BEFORE USE.

**WARNING**

Always operate the generator on a level surface. Placing the generator on non level surfaces can cause the generator to tip over, causing fuel and oil to spill. Spilled fuel can ignite if it comes in contact with an ignition source such as a very hot surface.

Do not operate a device plugged into the USB ports. Prolonged exposure to engine exhaust can cause serious injury or death. While charging a device do not place on the exhaust side of the generator. Extreme heat caused by exhaust can damage the device, and cause a potential fire hazard.

**NOTICE**

Only operate the generator on a solid, level surface. Operating the generator on a surface with loose material such as sand or grass clippings can cause debris to be ingested by the generator that could:
- Block cooling vents
- Block air intake system

**NOTICE**

Starting the generator with loads already applied to it could result in damage to any appliance being powered off the generator during the brief start-up period.

**Grounding the Generator** – The National Electric Code (NEC), as well as many local electrical codes, may require the generator to be connected to earth ground. The most common application that requires a ground rod is when you are using the generator as a separately derived system to provide back up power to your house. Typically this is when a transfer switch has a switched neutral.

As the generator application has many variables that cannot be determined by the manufacturer of the generator, a licensed electrician will need to determine if a grounding rod is needed.

If a licensed electrician has determined the application requires a ground rod, make sure it is connected to earth ground by connecting the ground terminal on the control panel to earth ground using copper wire (minimum 10 AWG). Consult a qualified electrician for local grounding requirements.

Neutral Bonded: There is a permanent conduct between the generator (stator winding) and the frame.

**WARNING**

Be sure the generator is properly connected to earth ground before operating. The generator must be grounded to prevent electrical shock due to faulty appliances.

High Altitude Operation

Engine power is reduced the higher you operate above sea level. Output will be reduced approximately 3.5% for every 1000ft of increased altitude from sea level. This is a natural occurrence and cannot be adjusted by engine. Increased exhaust emissions can also result due to increased fuel mixture. Other issues include hard starting, increased fuel consumption and spark plug fouling. Contact our service team 1-855-944-3571 for altitude part kits.

**High Altitude Carburetor Kit Part Number: 140546**

**High Altitude DF Regulator Part Number: 140547**

Note: You must purchase the Dual Fuel Regulator along with carburetor kit on the WGen7500DF
**POWERCORD**

**Using Extension Cords**
Westinghouse Portable Power assumes no responsibility for the content within this table. The use of this table is the responsibility of the user only. This table is intended for reference only. The results produced by using this table are not guaranteed to be correct or applicable in all situations as the type and construction of cords are highly variable. Always check with local regulations and a licensed electrician prior to installing or connecting an electrical appliance.

**Using Westinghouse Power Cord**
Use the extension cord chart to determine the size of the conductor for extension cord applications. Determine the distance of the generator to the appliance on the top line of the chart. Then select the rated amperage of the generator on the left side of the chart. Where the two meet is the size of the conductor required for the application.

The WCG25 power cord is connected to the generator at the 120/240 plug. The opposite end of the power cord is a fan tail receptacle with 2 green receptacles and 2 red receptacles. Each receptacle is rated at 120 volts AC. To balance the load on the generator’s alternator, use the red and green identifiers on the fan tail receptacle. To keep the load balanced, connect the loads so that both color receptacles are used. An example is one in red and one in green. Do not connect 2 in red and none in green, or 2 in green and none in red. If only one color receptacle is used with multiple loads, the alternator may experience an unbalanced load, causing undue vibration to generator.
Before starting the generator, always check:

- Level of Engine oil
- Level of gasoline in the fuel tank
- Secured connection to an undamaged LPG tank

It is not safe to add gasoline to the fuel tank or engine oil to the engine while the engine is running or the engine and muffler are hot.

**CHECKING AND / OR ADDING ENGINE OIL**

**WARNING**

Internal pressure can build in the engine crankcase while the engine is running. Removing the oil fill plug/ dipstick while the engine is hot can cause extremely hot oil to spray out of the crankcase and can severely burn skin. Allow engine oil to cool for several minutes before removing the oil fill plug/ dipstick.

The unit as shipped does not contain oil in the engine. You must add engine oil before starting the generator for the first time. See Checking Engine Oil and Adding Engine Oil on page 24 for instructions on checking engine oil level and the procedure for adding engine oil.

**NOTICE**

The engine does not contain engine oil as shipped. Attempting to start the engine can damage engine components. The owner of the generator is responsible to ensure the proper oil level is maintained during the operation of the generator. Failure to maintain the proper oil level can result in engine damage.

**NOTICE**

During the first five hours of operating the generator make sure to not exceed 50% of the rated running watts until the unit is broken in properly. Make sure to vary to load occasionally to allow stator windings to heat and cool. Adjusting the load will also help seat piston rings. Check oil more often during the first couple times of operating the generator.

**NOTICE**

Weather will affect engine oil performance. Change the type of engine oil used based on weather conditions to suit the engine needs.
**OPERATION**

**ADDING GASOLINE TO THE FUEL TANK**

**STOP**

**BEFORE ADDING GAS TO THE TANK**

**PLEASE REVIEW FUEL SAFETY SECTION ON PAGE 9**

---

**WARNING**

Never refuel the generator while the engine is running.

Always turn the engine off and allow the generator to cool before refueling.

---

**Required Gasoline** – Only use gasoline that meets the following requirements:
- Unleaded gasoline only
- Gasoline with maximum 10% ethanol added
- Gasoline with an 87 octane rating or higher

**Filling the Fuel Tank** – Follow the steps below to fill the fuel tank:
1. Shut off the generator.
2. Allow the generator to cool down so all surface areas of the muffler and engine are cool to the touch.
3. Move the generator to a flat surface.
4. Clean area around the fuel cap.
5. Remove the fuel cap by rotating counterclockwise.
6. Slowly add gasoline into the fuel tank. Be very careful not to overfill the tank. The gasoline level should NOT be higher than the filler neck (see Figure 7).
7. Install the fuel cap by rotating clockwise until you hear a click, indicating the cap is completely installed.

---

**Figure 7 - Maximum Gasoline Fill Level**

---

**CONNECTING THE LPG/PROPANE TANK**

**STOP**

**BEFORE CONNECTING PROPANE TANK TO THE GENERATOR PLEASE REVIEW FUEL SAFETY SECTION ON PAGE 9**

**Connecting LPG Tank**

1. Make sure the generator is off, on a flat surface in a well ventilated area.
2. Make sure propane tank valve is in the off position.
3. Make sure the fuel selector switch on the generator control panel is pointing downward to “Propane”.
4. Remove the plastic cover on the generator propane inlet valve.
5. Using your fingers tighten the LPG hose (included) end below to the generator propane inlet. DO NOT OVER-TIGHTEN 35-88 lb-in maximum.
6. Attach the other end of the hose to a tank of LPG/Propane and hand tighten.
7. Check all connections for leaks by wetting the fittings with soapy water. Anywhere that bubbles appear or grow indicates a leak in the connection. If a leak exists at a fitting then turn off the tank valve and tighten the fitting. Turn the gas back on and recheck with soapy water again. If the leak continues or if the leak is not at a fitting then do not use the generator and contact customer service.

---

**NOTICE**

- Use only standard 20 or 30 pound capacity LPG tanks with Type 1, right hand Acme threads.
- Verify the requalification date on the tank has not expired.
- All new tanks must be purged of air and moisture prior to filling. Used tanks that have not been plugged or kept closed must also be purged.
- The purging process should be done by a LPG supplier. (Tanks from an exchange supplier should have been purged and filled properly already)
- Always position the tank so the connection between the valve and the gas inlet won’t cause sharp bends or kinks in the hose.

---

**WARNING**

Do not start generator if you smell propane. This may result in explosion hazard. Do not use provided LPG hose for any other appliances. Always turn off the propane tank and disconnect LPG hose when not in use.
BEFORE STARTING THE GENERATOR

Before attempting to start the generator, verify the following:

- The engine is filled with engine oil. See Checking Engine Oil on page 24.
- The generator is situated in a proper location (Location Selection on page 16).
- The generator is on a dry surface (Weather and Dry Surface on page 16).
- All loads are disconnected from the generator (No Connected Loads on page 16).
- The generator is properly grounded the Generator (page 16).
- Propane connection is secure with no leaks or damage. See Connecting LPG Tank on page 19.

DANGER

Never use the generator in a location that is wet or damp. Never expose the generator to rain, snow, water spray or standing water while in use. Protect the generator from all hazardous weather conditions. Moisture or ice can cause a short circuit or other malfunction in the electrical circuit.

Never operate the generator in an enclosed area. Engine exhaust contains carbon monoxide. Only operate the generator outside and away from windows, doors and vents.

NOTICE

The engine is equipped with a low oil shutdown switch. If the oil level becomes low, the engine may shut down and not start until the oil is filled to the proper level. Poor oil quality may interfere with the operation of the low oil shutdown switch.

The owner of the generator is responsible to ensure the proper oil level is maintained during the operation of the generator. Failure to maintain the proper oil level can result in engine damage.

NOTICE

When operating on LPG it is common for frost to form on the tank and regulators. This is not an indication of a problem. The amount of frost that forms can be affected by the size of the container, the amount of fuel being used, the humidity of the air and other operating conditions. In standard use this frost may reduce flow of gas and lower performance. If frost becomes an issue try exchanging fuel tanks to allow the first tank to warm up. You can also temporarily warm the tank up by pouring warm water over the top of the propane tank.

SWITCHING FUEL SOURCES

The below assumes that the propane fuel line is already attached to the generator securely.

Switching from gasoline to propane:
1. With the engine running, turn the gasoline fuel shut off valve to OFF.
2. The engine will stop running when the gasoline in the carburetor has been consumed.
3. Turn the fuel selector knob to propane.
4. Open the propane fuel tank valve.
5. Start the engine. (The engine may take a few seconds to start until the propane has reached the carburetor from the propane fuel tank.)

Switching from propane to gasoline:
1. With the engine running, close the propane fuel tank valve.
2. The engine will stop running when the propane in the carburetor has been consumed.
3. Turn the fuel selector knob to gasoline.
4. Turn the gasoline fuel valve to ON.
5. Start the engine. (The engine may take a few seconds to start until the gasoline has filled the carburetor bowl from the gasoline fuel tank.)

NOTICE

To prevent engine damage do not turn the fuel selector knob while the unit is running without purging the leftover fuel (propane/gas) from the carburetor.

If the remaining fuel in the carburetor was not purged before stopping the unit in the last operation, make sure to start the generator on the same fuel source that was previously used to prevent engine sputtering.
STARTING THE GENERATOR

1. Move generator to a flat surface outside in a well ventilated area.

2. Check oil levels (see Adding Engine Oil page 24).

3. Verify the battery is installed and both battery cables are attached to their corresponding polarity. See Installing the Battery on page 12 (Battery must be connected for recoil start to work).

4. Disconnect all electrical loads from the generator.

5. Make sure the circuit breakers are properly set (see Figure 8 below).

4. Select fuel source for start up:

FOR GASOLINE:
   a. Move the fuel shut off valve to the ON position (see Figure 9).
   b. Turn fuel selector knob to GASOLINE (see Figure 9).

FOR LPG/PROPANE:
   a. Make sure the LPG hose is safely secured from the generator to the tank (see Connecting the LPG Tank on page 19).
   b. Turn the fuel selector knob to PROPANE (see Figure 10).
   c. Fully open the valve on the propane tank.

5. Switch the engine switch to RUN (see Figure 11).

6. Choose starting method:
   a. Recoil Start: Firmly grasp and pull the recoil handle slowly until you feel increased resistance. At this point, apply a rapid pull while pulling up and slightly away from the generator.
   b. Remote Start: Click START on the wireless key FOB provided.
   c. Push Button Start: Push and hold the engine start push button for 1 second and release.
      - The engine will automatically set the choke and begin the start sequence.
      - If the engine has started successfully the light indicator on the engine start button will turn green.
      - If the engine fails to start, the generator controls will attempt to start the engine two more times for a total of three attempts.
      - If the third attempt fails, the light on the engine start button will turn red.
      - If the engine has failed to start after three attempts the engine start button can be pushed again to begin the automatic start sequence.
      - The red engine stop button can be pushed at any time during the automatic start sequence to abort the engine start attempt.
STopping the generator

Normal Operation
During normal operation, use the following steps to stop your generator:

1. Remove any connected loads from the control panel receptacles.
2. Allow the generator to run at “no load” to reduce and stabilize engine and alternator temperatures.
3. If you are operating on gas move the fuel shut off valve to OFF (see Figure 12). If you are operating on propane shut off the tank valve (see Figure 13). Wait for engine to shut off due to lack of fuel.
4. Position the engine control switch to STOP (see Figure 14).

NOTICE
If you plan on running the generator on the same fuel source next time you start it then you can simply hit the Push Button Start button once or click STOP on wireless remote key FOB. The carburetor does not have to be purged if you plan on starting the generator on the same fuel source that was last used.

During an Emergency
If there is an emergency and the generator must be stopped quickly, position the engine control switch to the STOP position immediately.

Warning
Internal pressure can build in the engine crankcase while the engine is running. Removing the oil fill plug/dipstick while the engine is hot can cause extremely hot oil to spray out of the crankcase and can severely burn skin. Allow engine oil to cool for several minutes before removing the oil fill plug/dipstick.

MAINTENANCE

BEFORE PERFORMING MAINTENANCE ON THE GENERATOR, REVIEW THE SAFETY SECTION STARTING ON PAGE 5, AS WELL AS THE FOLLOWING SAFETY MESSAGES.

WARNING
Avoid accidentally starting the generator during maintenance by removing the spark plug boot from the spark plug. For electric start generators, also disconnect the battery cables from the battery (disconnect the black negative (-) cable first) and place the cables away from the battery posts to avoid arcing.

WARNING
Always perform maintenance in a well-ventilated area. Gasoline fuel and fuel vapors are extremely flammable and can ignite under certain conditions.

Allow hot components to cool to the touch prior to performing any maintenance procedure.
## MAINTENANCE SCHEDULE

### WARNING

Failure to perform periodic maintenance or not following maintenance procedures can cause the generator to malfunction and could result in death or serious injury.

### NOTICE

Periodic maintenance intervals vary depending on generator operating conditions. Operating the generator under severe conditions, such as sustained high-load, high-temperature, or unusually wet or dusty environments, will require more frequent periodic maintenance. The intervals listed in the maintenance schedule should be treated only as a general guideline.

### CAUTION

Avoid skin contact with engine oil or gasoline. Prolonged skin contact with engine oil or gasoline can be harmful. Frequent and prolonged contact with engine oil may cause skin cancer. Take protective measures and wear protective clothing and equipment. Wash all exposed skin with soap and water.

Following the maintenance schedule is important to keep the generator in good operating condition. The following is a summary of maintenance items by periodic maintenance intervals.

### TABLE 1: MAINTENANCE SCHEDULE - OWNER PERFORMED

MAINTENANCE

ENGINE OIL MAINTENANCE

Engine Oil Specification

1. Only use the engine oil specified in Figure 15.
2. Only use 4-stroke/cycle engine oil. NEVER USE 2-STROKE/CYCLE OIL. Synthetic oil is an acceptable substitute for conventional oil.

![Figure 15 - Recommended Oil](image)

CHECKING ENGINE OIL

**NOTICE**

Always maintain proper engine oil level. Failure to maintain proper engine oil level could result in severe damage to the engine and/or shorten the life of the engine. Always use the specified engine oil. Failure to use the specified engine oil can cause accelerated wear and/or shorten the life of the engine.

Engine oil level should be checked before every use.

1. Always operate or maintain the generator on a flat surface.
2. Stop engine if running.
3. Let engine sit and cool for several minutes (allow crankcase pressure to equalize).
4. With a damp rag, clean around the oil fill plug/dipstick.
5. Remove oil fill plug/dipstick (see Figure 16 below).

![Figure 16 - Oil Fill Plug/Dipstick](image)

6. Check oil level: When checking the engine oil, remove the oil fill plug/dipstick and wipe it clean. Thread the oil fill plug/dipstick all the way back in and then remove and check the oil level on the oil fill plug/dipstick.

- **Acceptable Oil Level** – Oil is visible on the crosshatches between the H and L lines on the oil fill plug/dipstick (see Figure 17).
- **Low Oil** – Oil is below the L line on the oil fill plug/dipstick.

![Figure 17 - Checking Oil Level](image)

ADDING ENGINE OIL

1. Always operate or maintain the generator on a flat surface.
2. Stop engine if running.
3. Let engine sit and cool for several minutes (allow crankcase pressure to equalize).
4. Thoroughly clean around the oil fill plug/dipstick.
5. Remove oil fill plug/dipstick and wipe clean.
6. Select the proper engine oil as specified in Figure 15.
7. Using the supplied funnel and tube, slowly add engine oil to the engine. Stop frequently to check the level to avoid overfilling.
8. Continue to add oil until the oil is at the correct level. See Figure 17.
MAINTENANCE

CHANGING ENGINE OIL

1. Stop the engine.
2. Let engine sit and cool for several minutes (allow crankcase pressure to equalize).
3. Place oil pan (or suitable container) under the oil drain plug (see Figure 18).
4. With a damp rag, thoroughly clean around the oil drain plug.
5. Remove the oil drain plug (see Figure 18). Once removed, place the oil drain plug on a clean surface.
6. Allow oil to completely drain.
7. Replace oil drain plug.
8. Fill crankcase with oil following the steps outlined in Adding Engine Oil on page 24.

NOTICE
Never dispose of used engine oil by dumping the oil into a sewer, on the ground, or into ground water or waterways. Always be environmentally responsible. Follow the guidelines of the EPA or other governmental agencies for proper disposal of hazardous materials. Consult local authorities or reclamation facility.

AIR FILTER MAINTENANCE

WARNING
Never use gasoline or other flammable solvents to clean the air filter. Use only household detergent soap to clean the air filter.

Cleaning the Air Filter
The air filter must be cleaned after every 50 hours of use or 3 months (frequency should be increased if generator is operated in a dusty environment).

1. Turn off the generator and let it cool for several minutes if running.
2. Move the generator to a flat, level surface.
3. Unclip the clips on the top and bottom of the air filter cover (Figure 19).
4. Remove the black coarse air filters.
5. Wash the foam air filter elements by submerging the elements in a solution of household detergent soap and warm water. Slowly squeeze the foam to thoroughly clean.
6. Rinse in clean water by submerging the air filter elements in fresh water and applying a slow squeezing action.

NOTICE
NEVER twist or tear the foam air filter element during cleaning or drying. Only apply slow but firm squeezing action.
Cleaning the Air Filter - Continued from Page 25

NOTICE
Never dispose of soap cleaning solution used to clean the air filter by dumping the solution into a sewer, on the ground, or into ground water or waterways. Always be environmentally responsible. Follow the guidelines of the EPA or other governmental agencies for proper disposal of hazardous materials. Consult local authorities or reclamation facility.

7. Dispose of used soap cleaning solution properly.
8. Dry the air filter elements by again applying a slow firm squeezing action.
9. Once the air filters are dry, coat the air filters with clean engine oil (see Figure 20 below).

Figure 20

10. Squeeze the filters to remove any excess oil.
11. Install the filters back into the unit. If there are two filters make sure the gray (fine) air filter goes in first followed by the black (coarse) air filter on the outside.
12. Install the air filter cover and secure the air filter assembly.

SPARK PLUG MAINTENANCE
The spark plug must be checked and cleaned after every 100 hours of use or 6 months and must be replaced after 300 hours of use or every year.

1. Stop the generator and let it cool for several minutes if running.
2. Move the generator to a flat, level surface.
3. Remove the spark plug boot by firmly pulling the plastic spark plug boot handle directly away from the engine (see Figure 21).

Figure 21 - Remove Spark Plug Boot

4. Clean area around the spark plug.
5. Using the 13/16” spark plug socket wrench provided, remove the spark plug from the cylinder head.
6. Place a clean rag over the opening created by the removal of the spark plug to make sure no dirt can get into the combustion chamber.
   - Inspect the spark plug for:
     - Cracked or chipped insulator
     - Excessive wear
     - Spark plug gap (the acceptable limit of 0.027–0.032 in. [0.70 – 0.80 mm]) (see Figure 22).

Figure 22

7. Install the spark plug by carefully following the steps outlined below:
   a. Carefully insert the spark plug back into the cylinder head. Hand-thread the spark plug until it bottoms out.
   b. Using the 13/16” spark plug socket wrench provided, turn the spark plug to ensure it is fully seated.
   c. Replace the spark plug boot, making sure the boot fully engages the spark plug’s tip.

Recommended Spark Plug Replacement:
AC Delco: 4EXLS
Autolite: 52
Champion: N9YC
Bosch: W7DC
Torch: F7TC

NOTICE
Use only recommended spark plugs when servicing. The manufacturer is not responsible for engine damage when using spark plugs not recommended by the manufacturer.
MAINTENANCE

CHECKING AND ADJUSTING VALVE LASH

⚠️ CAUTION

Checking and adjusting valve lash must be done when the engine is cold.

1. Remove the rocker arm cover and carefully remove the gasket. If the gasket is torn or damaged, it must be replaced.

2. Remove the spark plug so the engine can be rotated more easily.

3. Rotate the engine to top dead center (TDC) of the compression stroke. Looking through the spark plug hole, the piston should be at the top.

4. Both the rocker arms should be loose at TDC on the compression stroke. If they are not, rotate the engine 360°.

5. Insert a feeler gauge between the rocker arm and the push rod and check for clearance (see Figure 23). See Table 2 for valve lash specifications.

6. If an adjustment is required, hold the adjusting nut and loosen the jam nut.

7. Turn the adjusting nut to obtain the correct valve lash. When the valve lash is correct, hold the adjusting nut and tighten the jam nut to 106 in-lb (12 N•m).

8. Recheck the valve lash after tightening the jam nut.

9. Perform this procedure for both the intake and exhaust valves.

10. Install the rocker arm cover, gasket and spark plug.

TESTING GFCI OUTLETS

1. Start the generator and allow it to warm up.

2. Press the test button on the GFCI outlet.

3. The reset button should pop out and there will be no power from the outlets. If the reset button does not pop out, the GFCI outlet is not working correctly and must be repaired before the generator can be operated.

4. Press the reset button to restore power to the outlet.

BATTERY SERVICE

To ensure the battery remains charged, the generator should be started every 2 to 3 months and run for a minimum of 15 minutes or the charger (included) should be plugged into the generator and the generator should be charged overnight. Make sure the engine control switch is in the “RUN” position when charging. Plug the cord from the charger into the charging port on the generator. Plug the charger into a 110/120-volt AC outlet.

Battery Replacement

1. Remove the spark plug wire from spark plug.
2. Loosen and remove the bolt on the battery hold-down plate and swing the plate out.
3. Tip the battery forward slightly to access battery cables.
4. Disconnect the black negative (-) battery cable from the battery first.
5. Disconnect the red positive (+) battery cable second and remove the battery.

**NOTICE**
Dispose of the used battery properly according to the guidelines established by your local or state government.

6. Install the new battery into the generator frame.
7. Connect the red positive (+) battery cable to the battery first.
8. Connect the black negative (-) battery cable to the battery second.
9. Install the battery hold-down plate using the nuts removed in step 2.
10. Install the spark plug wire onto spark plug.

See below for the battery specification when replacing the battery.

Clean All Alternator Cooling Air Inlets and Exhaust Ports – Make sure the cooling air inlets and exhaust ports of the alternator are free of any debris and obstructions. Use a vacuum cleaner to remove dirt and debris stuck in the cooling air inlets and exhaust ports.

General Cleaning of the Generator – Use a damp rag to clean all remaining surfaces.

STORING GENERATOR

**WARNING**

Never store a generator with fuel in the tank indoors or in a poorly ventilated area where the fumes can come in contact with an ignition source such as: 1) pilot light of a stove, water heater, clothes dryer or any other gas appliance; or 2) spark from an electric appliance.

**NOTICE**

Gasoline stored for as little as 60 days can go bad, causing gum, varnish and corrosive buildup in fuel lines, fuel passages and the engine. This corrosive buildup restricts the flow of fuel, preventing an engine from starting after a prolonged storage period.

Proper care should be taken to prepare the generator for any storage.

1. Make sure the Engine Switch is switched to STOP so the generator does not draw power from battery.
2. Clean the generator as outlined in Cleaning the Generator.
3. Drain all gasoline from the fuel tank as best as possible.
4. With the fuel shut off valve open, start the engine and allow the generator to run until all the remaining gasoline in the fuel lines and carburetor is consumed and the engine shuts off. If you used propane the last time you ran the generator: start the unit up with propane then shut off the propane tank valve allowing the engine to use up all the remaining propane in the carburetor before it shuts off.
5. Close the fuel shut off valve.
6. Change the oil (see Changing Engine Oil on page 25).
7. Remove the spark plug (see Spark Plug Maintenance on page 26) and place about 1 tablespoon of oil in the spark plug opening. While placing a clean rag over the spark plug opening, slowly pull there coil handle to allow the engine to turn over several times. This will distribute the oil and protect the cylinder wall from corroding during storage.
8. Replace the spark plug (see Spark Plug Maintenance on page 26).
9. Move the generator to a clean, dry place for storage.

CLEANING THE GENERATOR
It is important to inspect and clean the generator before every use.

Clean All Engine Air Inlet and Outlet Ports – Make sure all engine air inlet and outlet ports are clean of any dirt and debris to ensure the engine does not run hot.

Clean All Engine Cooling Fins – Use a damp rag and a brush to loosen and remove all dirt on or around the engine’s cooling fins.
### WARNING

Before attempting to service or troubleshoot the generator, the owner or service technician must first read the owner’s manual and understand and follow all safety instructions. Failure to follow all instructions may result in conditions that can lead to voiding of the EPA certification or product warranty, serious personal injury, property damage or even death.

<tr>
<td><strong>Generator suddenly stops running.</strong></td>
<td>1. Generator is out of fuel.</td>
<td>1. Check fuel level. Add fuel if necessary.</td>
</tr>
<tr>
<td></td>
<td>2. The low oil shutoff switch has stopped the engine.</td>
<td>2. Check oil level and add oil if necessary (see page 24).</td>
</tr>
<tr>
<td></td>
<td>3. Too much load</td>
<td>3. Restart the generator and reduce the load.</td>
</tr>
<tr>
<td></td>
<td>4. If trying 1-3 above does not solve the problem, the cause might be a fault in the generator.</td>
<td>4. Take the generator to your nearest authorized service dealer.</td>

# TROUBLESHOOTING

<table>
<thead>
<tr>
<th>PROBLEM</th>
<th>POTENTIAL CAUSE</th>
<th>SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine runs erratic; does not hold a steady RPM.</td>
<td>1. Dirty air filter</td>
<td>1. Clean the air filter (see pages 25-26).</td>
</tr>
<tr>
<td></td>
<td>2. Applied loads maybe cycling on and off</td>
<td>2. As applied loads cycle, changes in engine speed may occur; this is a normal condition.</td>
</tr>
<tr>
<td></td>
<td>3. If trying 1-3 above does not solve the problem, the cause might be a fault in the generator</td>
<td>3. Take the generator to your nearest authorized service dealer.</td>
</tr>
<tr>
<td>Push button start is not working and the cranking speed drops after each attempt.</td>
<td>1. Battery is not adequately charged</td>
<td>1. Turn the engine switch to “Run” and hook up the battery charger (provided) for 1 hour.</td>
</tr>
<tr>
<td></td>
<td>2. Try manually starting the generator to let the battery charge while it is operating.</td>
<td></td>
</tr>
<tr>
<td>Frost on the propane tank or regulator</td>
<td>1. This can be a normal occurrence caused when liquid propane changes phase to a gas. As this process occurs the fuel tank or regulator will cool and allow humid air surrounding the propane tank or regulator to condense into frost.</td>
<td>1. As this can be normal, providing all the propane fuel handling equipment is functioning normally, no remedy is needed.</td>
</tr>
<tr>
<td></td>
<td>2. The propane tank is not equipped with a OPD (rollover protection device) and has been stored in a horizontal position allowing liquid propane to enter the downstream fuel handling equipment.</td>
<td>2. If you suspect your propane fuel tank is not equipped with a OPD device, discontinue operation immediately and replace the propane fuel tank with a propane tank equipped with a roll over protection device.</td>
</tr>
<tr>
<td></td>
<td>3. Propane fuel tank over filled.</td>
<td>3. If you suspect your propane fuel tank has been overfilled, discontinue operation immediately and return the propane fuel tank to the place of purchase or refilling.</td>
</tr>
<tr>
<td>Propane fuel smell</td>
<td>1. Fuel regulator or fuel hose and fittings not securely sealed.</td>
<td>1. Using a soap solution check each connection and tighten as needed.</td>
</tr>
<tr>
<td></td>
<td>2. Propane fuel regulator vent active.</td>
<td>2. The propane fuel regulator is equipped with a small vent that will allow a small amount of propane fuel vapor to escape from the regulator when the propane tank valve is opened. This can be normal providing the venting of the propane is brief. If you suspect that this is abnormal, immediately discontinue use and have the propane regulator inspected by a qualified technician.</td>
</tr>
<tr>
<td></td>
<td>3. Residual fuel from the carburetor dispersing after operation.</td>
<td>3. Normal, no remedy is needed.</td>
</tr>
<tr>
<td>Poor performance or engine stalling</td>
<td>1. Propane fuel line kinked or crushed.</td>
<td>1. Inspect propane fuel line and remove kinks or other obstructions.</td>
</tr>
<tr>
<td></td>
<td>2. Fuel selector valve not properly positioned.</td>
<td>2. Rotate the fuel valve fully until the pointer is directly in line with the desired fuel.</td>
</tr>
<tr>
<td></td>
<td>3. Gasoline not purged from the carburetor before switching to propane.</td>
<td>3. Turn the propane fuel tank valve to closed. Move the fuel selector valve to propane. Turn the gasoline fuel valve to off. Start the engine and allow the engine to run until the fuel has been consumed in the carburetor. Begin propane start up procedure.</td>
